

A. Canonical 4-rater cohort (MW, SZ, TZ, AS): Frequency (Spearman ρ)

B. Canonical cohort: Laterality (Cohen κ)

C. Prior 4-rater cohort (PH, LB, SZ, MW): Frequency (Spearman ρ)

Laterality not annotated
on the prior cohort
(PH, LB).

Stars: paired segment-level bootstrap (2000 resamples) of $\text{mean}(\text{EA}) - \text{mean}(\text{EE})$. + favors algorithm; - favors experts. *** $p < 0.001$ ** $p < 0.01$ * $p < 0.05$. Bars: 95% CI on the mean from the same bootstrap. Open circles: per-pair point estimates (canonical: 6 EE pairs + 4 EA pairs; prior: 6 EE + 4 EA). y-axis truncated.
